

1. Stakeholder Conflict

1.1) Which stakeholder did you choose to prioritize?

We prioritized the anonymity of the users. Because we found the Tenant-end more logical for the approach. We primarily did this because we think that the pins dropped with names on them could be misused if there is a data leak. Furthermore, rather than a data leak, the names on the pins might be intentionally misused for “pre-determined” discrimination about users. We thought this primarily because of the gear-up session about redlining.

1.2) How did you choose to persistently store the user data associated with pins and why? Please highlight how your decision addressed the specific concerns raised by the stakeholder that you prioritized.

We stored data using anonymous user IDs. That way, only Firebase knows which user added which pin. Only the number generated by the Clerk would be visible to the leakers in a data leak.
