

## 1. Stakeholder Conflict

1.1) Which stakeholder did you choose to prioritize?

We prioritized stakeholder 2, since we believe that users should be able to report their negative experiences anonymously, since this is a crucial component of any kind of feedback system. We understand the disadvantage of landlords being able to post fake reviews, but we believe that this still does not outweigh the importance of anonymity, and there could be other ways to prevent this issue, e.g. through authentication.

1.2) How did you choose to store the user data associated with pins and why? Please highlight how your decision addressed the specific concerns raised by the stakeholder that you prioritized. (Naturally, you'll be storing this data in a mock for 5.1. Our goal is to understand *which aspects* of user data you plan to store and *why*.)

Since we prioritize anonymous data storage, we only store pin locations in our mock json file, maintaining information about the latitude and longitude of each pinpoint location. We also plan to continue with this for the next sprint as well.
